

Lone Worker Protection

 **Strengthen your employees' safety with lone worker protection!**

With **team on the run (TOTR)**, team members are protected even if working alone or in isolated areas thanks to our **Lone Worker Protection (LWP)** functions which consists of the **Emergency Alert System with (messaging or voice call)** and the **Man-Down Alert**.

Emergency Alert System

- User can manually trigger an emergency via device panic button from a rugged phone/tablet or sim-enabled radio, directly from TOTR app screen, or via a wireless button accessory via Bluetooth connection.
- When an emergency alert is triggered by a user, the recipients of the emergency alert will receive the real-time location of the user's device for tracking and will have options to communicate with user via VoIP call, push-to-talk, or messaging to provide help and ask user questions regarding emergency.
- Administrator can predefine custom emergency messages and set who the recipients for the emergency alerts should be in the organization when an alert is triggered.
- Users can specify the severity level so you can intervene and send proper support for emergency. Types of severity levels: *Critical, Severe, Urgent*

Man-Down Alert

- Man-Down Alert is a function designed for employees working in isolated environments, without close or direct supervision. The alert is automatically sent to the designated recipients each time the device exceeds the threshold angle set by the administrator. The manager can be informed quickly and the worker in danger can get help in a timely manner.
- Users can activate man-down alert from device before starting a job, if the user falls from a ladder and lays on the ground, an alert will be sent due to the detection of device angle is horizontal.
- Positive security (detection of absence of connection during a certain period)
